

**Preventing Infection from Cow Dropping by
Using Robot Helpers**

by

The issue:

Cows defecate on the grass.

Cows eat the grass that has the defecation on it.

Cows therefore are eating lots of defecation.

Therefore, the Cows very often become infected often with many worms and other things that effect their well being and then the Cows require antibiotics and other forms of medical treatment.

Thus, we need to institute, Robot Helpers, that will follow the Cows and sense when a Cow is about to defecate.

The Robot Helper can either catch the defecation while it is exiting or they can clean it up immediately after and disinfect the area with some kind of organic means.

This solution will make it so the Cow's do NOT require the antibiotics as often, or hopefully, at all.

We need to protect the Cows and what they eat!

By caring for the Cows well being we are caring for our well being as well!
